# Outline

- What is a **Combinatorial Hopf Algebra**.
- **Sym** is a **strong** CHA.
- **Restriction** on original definition of strong CHA
- How to make **NCSym** a **strong** CHA.

## Combinatorial Hopf Algebra

$H = \bigoplus_{n \geq 0} H_n$  a graded connected Hopf algebra is **CHA** if

(weak) There is a distinguished basis with positive integral structure coefficients.

(med) it is weak CHA with a distinguish character.

[combinatorial Identity]

(strong) it is med CHA such that the structure is obtained from representation operation

[Combinatorics of structure constants]

(Bonus) It is the functorial image of a Hopf monoid.

[Combinatorial objects]

## Sym is a strong CHA

**Sym** is the space of symmetric functions  $\mathbb{Z}[h_1, h_2, \dots]$ , with  $\deg(h_k) = k$  and

$$\Delta(h_k) = \sum_{i=0}^k h_i \otimes h_{k-i}.$$

It is a **strong CHA**:

- **Basis**: Schur functions  $s_\lambda$
- **Representation** of symmetric groups and Frobenius map:

$$\mathcal{F}: \bigoplus_{n \geq 0} K_0(S_n) \rightarrow \text{Sym}$$

is an **isomorphism** of graded Hopf algebra where  $\mathcal{F}(M^\lambda) = s_\lambda$

## Hopf structure on $\bigoplus_{n \geq 0} K_0(S_n)$

$K_0(S) = \bigoplus_{n \geq 0} K_0(S_n)$  is the space of  $S_n$ -modules up to isomorphism

- **Basis:** Irreducible modules  $M^\lambda$
- **Structure:**

$$M * N = \text{Ind}_{S_n \times S_m}^{S_{n+m}} M \otimes N$$

$$\Delta M = \bigoplus_{k=0}^n \text{Res}_{S_k \times S_{n-k}}^{S_n} M$$

- $\mathcal{F}: K_0(S) \rightarrow \text{Sym}$  is an **isomorphism** of graded Hopf algebra where  $\mathcal{F}(M^\lambda) = s_\lambda$

Sym is a strong CHA

## Original definition of strong CHA

Consider a graded algebra  $A = \bigoplus_{n \geq 0} A_n$

- Each  $A_n$  is an algebra.
- $\dim A_0 = 1$  and  $\dim A_n < \infty$ .
- $\rho_{n,m} : A_n \otimes A_m \hookrightarrow A_{n+m}$ ; injective algebra homomorphism
- $A_{n+m}$  is projective bilateral submodule of  $A_m \otimes A_n$ .
- Right and left projective structure of  $A_{n+m}$  are compatible.
- There is a Makey formula linking induction and restriction

$A$  is a tower of algebra

## Original definition of strong CHA

Consider a tower of algebras  $A = \bigoplus_{n \geq 0} A_n$

Let  $K_0(A) = \bigoplus_{n \geq 0} K_0(A_n)$  is the space of projective  $A_n$ -modules up to isomorphism and modulo short exact sequences

- $K_0(A)$  is a **graded Hopf algebra**:

$$M * N = \text{Ind}_{A_n \otimes A_m}^{A_{n+m}} M \otimes N$$

$$\Delta M = \bigoplus_{k=0}^n \text{Res}_{A_k \otimes A_{n-k}}^{A_n} M$$

- $H$  is a **strong CHA** if there is an  $A$  an **isomorphism**

$$\mathcal{F}: K_0(A) \rightarrow H$$

- $Sym, QSym, NSym$ , are strong CHA.

## Original definition of strong CHA

Consider a tower of algebras  $A = \bigoplus_{n \geq 0} A_n$

Let  $K_0(A) = \bigoplus_{n \geq 0} K_0(A_n)$  is the space of projective  $A_n$ -modules up to isomorphism and modulo short exact sequences

- $K_0(A)$  is a **graded Hopf algebra**:
- $H$  is a **strong CHA** if there is an  $A$  an **isomorphism**

$$\mathcal{F}: K_0(A) \rightarrow H$$

**THEOREM**[B-Lam-Li]

if  $A$  is a tower of algebras, then  $\dim(A_n) = r^n n!$

this is very restrictive... For example, it seems **hopeless** to find a tower of algebras for  $NC\text{Sym}$  (symmetric functions in non-commutative variables) .

# How to make $NC\text{Sym}$ a strong CHA

$NC\text{Sym}$  symmetric functions in non-commutative variables.

- **Basis** monomial  $m_\lambda$  basis (sum of orbit of a word) **indexed by set partitions**

$$m_{(1,2,3)} \cdot m_{(1,2,3)} = m_{(1,2,3,4,5,6)} + m_{(1,2,3,4,5,6)} + m_{(1,2,3,4,5,6)}$$

$$+ m_{(1,2,3,4,5,6)} + m_{(1,2,3,4,5,6)} + m_{(1,2,3,4,5,6)} + m_{(1,2,3,4,5,6)}$$

$$\Delta \left( m_{(1,2,3,4)} \right) = m_{(1,2,3,4)} \otimes m_\emptyset + 2m_{(1,2,3)} \otimes m_1 + m_{(1,2)} \otimes m_{1,2} + m_{(1,2)} \otimes m_{1,2} + 2m_1 \otimes m_{(1,2,3)} + m_\emptyset \otimes m_{(1,2,3,4)}$$

## Supercharacter theory of $U_n(q)$

*lumping* conjugacy classes and characters together to get a more tame theory [André, Diaconis-Isaac](#).

- Unipotent upper triangular matrices over finite Fields  $\mathbf{F}_q$ :  $U_n(q)$ .
- Superclasses in  $U_n(q)$ :

$$A \cong B \quad \leftrightarrow \quad (A - I) = DM(B - I)N$$

superclass representative has at most one 1 in each row and column (strictly above the diagonal).

## Supercharacter theory of $U_n(q)$

*lumping* conjugacy classes and characters together to get a more tame theory [André, Diaconis-Isaac](#).

- Unipotent upper triangular matrices over finite Fields  $\mathbf{F}_q$ :  $U_n(q)$ .
- Superclasses in  $U_n(q)$   $\lambda$
- Supercharacters  $\chi^\lambda$  Hopf algebra structure [see ArXive 28 author paper](#):

$$\Delta(\chi) = \sum_{A+B=[n]} \text{Res}_{U_{|A|}(q) \times U_{|B|}(q)}^{U_n(q)} \chi$$
$$\chi \cdot \psi = \text{Inf}_{U_n(q) \times U_m(q)}^{U_{n+m}(q)} \chi \otimes \psi = (\chi \otimes \psi) \circ \pi$$

where  $\pi: U_{n+m}(q) \rightarrow U_n(q) \times U_m(q)$ .

# Supercharacter theory of $U_n(q)$

- Superclass functions  $\kappa_\lambda$  basis Hopf algebra structure is nice:

$$\begin{aligned}
 & \kappa_{(1,2)} \cdot \kappa_{(1,2)} = \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} \\
 & \quad + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} \\
 & \quad + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} \\
 & \quad + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} + \kappa_{(1,2,3,4,5,6)} \\
 & \Delta\left(\kappa_{(1,2,3,4)}\right) = \kappa_{(1,2,3,4)} \otimes \kappa_\emptyset + 2\kappa_{(1,2,3)} \otimes \kappa_1 + \kappa_{(1,2)} \otimes \kappa_{(1,2)} + \kappa_{(1,2)} \otimes \kappa_{(1,2)} \\
 & \quad + \kappa_{(1,2)} \otimes \kappa_{(1,2)} + 2\kappa_1 \otimes \kappa_{(1,2,3)} + \kappa_\emptyset \otimes \kappa_{(1,2,3,4)} .
 \end{aligned}$$

# Isomorphism

- the Hopf algebra of symmetric functions in noncommutative variables is isomorphic to the Hopf algebra of superclass functions.
- Where is  $q$ ? [see nice paper by Bergeron-Thiem in Int. J. of Algebra and Comp. 23 (4), 763-778]
- • •

## Conclusions

What is the right definition of strong CHA?

(A) Tower of algebra  $A$  (not nesc. same xioms)

(B) K-theory of super-module theory

(C) Harish-Chandra Induction/restriction as operation:

Ind  $\circ$  Inf

Def  $\circ$  Res

Here we try to maximize Inf and Def (in the case of symmetric group, there is no possible Inf, for  $U_n$ , it is all Inf)

$Gl_n$  is an example where we see a combination

Thank You!
